## Transformed Cartesian coordinate system

coord\_trans is different to scale transformations in that it occurs after statistical transformation and will affect the visual appearance of geoms - there is no guarantee that straight lines will continue to be straight.

```
coord_trans(x = "identity", y = "identity", limx = NULL, limy = NULL,
    xtrans, ytrans)
```

## Arguments

**x, y** transformers for x and y axes

limx, limy limits for x and y axes. (Named so for backward compatibility)

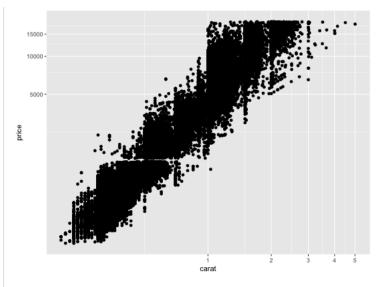

**xtrans**, **ytrans** Deprecated; use x and y instead.

## Details

Transformations only work with continuous values: see trans\_new (http://www.rdocumentation.org/packages/scales/topics/trans\_new) for list of transformations, and instructions on how to create your own.

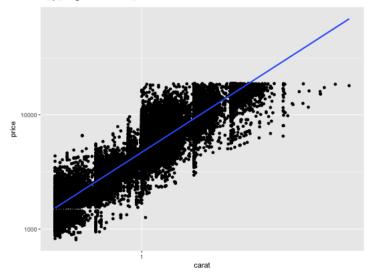

## Examples

```
# See ?geom_boxplot for other examples
# Three ways of doing transformation in ggplot:
\# * by transforming the data
ggplot (ggplot.html)(diamonds, aes (aes.html)(log10(carat), log10(price))) +
  geom_point (geom_point.html)()
  4.0
log10(price)
                               o.o
log10(carat)
\# * by transforming the scales
ggplot (ggplot.html)(diamonds, aes (aes.html)(carat, price)) +
  geom_point (geom_point.html)() +
  scale_x_log10 (scale_continuous.html)() +
  scale_y_log10 (scale_continuous.html)()
price
                                  carat
# * by transforming the coordinate system:
ggplot (ggplot.html)(diamonds, aes (aes.html)(carat, price)) +
  geom_point (geom_point.html)() +
  coord_trans(x = "log10", y = "log10")
```

- $\ensuremath{\text{\#}}$  The difference between transforming the scales and
- # transforming the coordinate system is that scale
- # transformation occurs BEFORE statistics, and coordinate
- # transformation afterwards. Coordinate transformation also
- # changes the shape of geoms:
- d <- subset(diamonds, carat > 0.5)

```
ggplot (ggplot.html)(d, aes (aes.html)(carat, price)) +
  geom_point (geom_point.html)() +
  geom_smooth (geom_smooth.html)(method = "lm") +
  scale_x_log10 (scale_continuous.html)() +
  scale_y_log10 (scale_continuous.html)()
```

```
ggplot (ggplot.html)(d, aes (aes.html)(carat, price)) +
  geom_point (geom_point.html)() +
  geom_smooth (geom_smooth.html)(method = "lm") +
  coord_trans(x = "log10", y = "log10")
```
